How I work Support replies Macro pack FAQ sample Writing samples What I'm not claiming

WHAT THIS IS

A working sample set, not a claim reel. Everything below is written the way I would actually answer a user or publish a post — sourced from public product documentation, checked before writing, kept short enough that someone reading on a phone gets the answer in one screen.

I have been on the *user* side of crypto support since 2023: airdrops, vesting claims, locked tokens, wrong-wallet submissions, exchange deposit addresses that cannot receive a claim. That is where the questions in this document come from. I know what users ask because I have asked it.

HOW I WORK

1. Read first
   Open the product's own help centre and find the exact article. If it does not exist, that is a documentation gap — worth flagging, not guessing.
2. Reproduce
   Walk the flow in the app before answering. An answer that has not been tested is a guess with confidence.
3. Answer short
   Steps in order, no preamble. One screen on mobile. If it needs more than six lines, it needs a screenshot or a link.
4. Name the limit
   If the fix is not mine to make, say who owns it and what happens next. Never leave a user guessing whether anyone is working on it.
5. Turn it into a macro
   If a question arrives twice, it becomes a saved reply and an FAQ entry. Same question three times is a documentation failure, not a support one.

SAMPLE SUPPORT REPLIES

Topics drawn from public Streamflow documentation — vesting, claiming, token locks, cancel flow. Written as live chat replies.

> 1. “My claim button is greyed out — nothing to claim?”
>
> Two things to check. First, is the vesting **cliff** over yet? Nothing unlocks before the cliff date, even if the contract is active. Second, open the contract detail page and look at *Claimable* — that number is what the button reads. If Claimable is 0, there is nothing to withdraw yet and the button is working correctly. If Claimable shows a number but the button stays disabled, send me the contract address and I will check the on-chain state.

> 2. “I created a vesting contract for my team. Can I cancel it later?”
>
> Only if cancellation was enabled when the contract was created. At setup the sender chooses whether the sender, the recipient, or neither may cancel — that permission is fixed at deployment and cannot be added afterwards. To check: open the contract and look at the details panel for the cancel permission. If neither party was given it, the contract runs to completion. If it was enabled, cancel from the three-dot menu on the contract row.

> 3. “I used my Binance deposit address as the vesting recipient. Now what?”
>
> Centralised exchange wallets cannot sign a claim transaction, so a contract paying into an exchange address has to use **Auto-Claim** — then the unlocked tokens are pushed straight to that address instead of waiting for a signature. If Auto-Claim was not enabled, the tokens are not lost: they are still in the contract, but only the recipient address can claim them, and an exchange will not do that for you. The practical fix is to create a new contract paying to a wallet you control, then cancel or let the old one run out.

> 4. “Why did I receive tokens I never bought?”
>
> Almost always an airdrop. Before you touch them, check two things: whether the token's mint authority is still active, and whether the token appears in the project's own official announcement. Unsolicited tokens that require you to visit a link and connect your wallet to “claim more” are the most common drain pattern in this space — the token itself is the bait, not the reward. If you want to be rid of it, burn the token account rather than interacting with any site it points to.

> 5. “The stream stopped paying out mid-schedule. Is the contract broken?”
>
> Usually not broken — empty. A streaming contract pays from the balance that was funded into it; if the sender did not top it up, the stream pauses when the balance hits zero and resumes once more is added. Open the contract and compare *Amount deposited* with *Amount streamed*. If deposited is lower, the sender needs to top up. If deposited is higher and it is still not paying, that is worth escalating with the contract address — send it over.

SUPPORT MACRO PACK

Ten saved replies for a live chat queue. Short by design — they get pasted into a conversation, not printed.

```
01 · ASK FOR THE ADDRESS
Before I can check anything I need the contract address (not the token
address) and the wallet you are claiming from. Copy from the app URL.

02 · CLIFF EXPLANATION
Nothing unlocks before the cliff date — that is expected behaviour, not a
bug. After the cliff, tokens unlock on the schedule in the contract.

03 · WRONG NETWORK
That address is on a different network than this app uses. Sending here will
not credit your account. Confirm the network in your wallet before you sign.

04 · EXCHANGE AS RECIPIENT
Exchange wallets cannot sign claims. Use Auto-Claim so tokens are pushed to
the address instead of waiting for a signature.

05 · TRANSACTION PENDING
It is still in the queue, not failed. Give it a minute, then check the
explorer link. If it shows as dropped, resubmit — nothing was charged.

06 · CANNOT CANCEL
Cancellation permission is set when the contract is created and cannot be
added later. If neither party was granted it, the contract runs to completion.

07 · TOKENS RECEIVED, DID NOT BUY
Most likely an airdrop. Do not connect your wallet to any site it points to.
Check the project's official channel before interacting.

08 · ESCALATING A BUG
Thanks — I have reproduced this and passed it to the team with your contract
address and a timestamp. I will come back to you here when there is an update.

09 · SCOPE LIMIT
I cannot sign or move funds on your behalf, and no one from support will ever
ask for a seed phrase or private key. Anyone who does is impersonating us.

10 · CLOSING WITH A POINTER
Sorted. If it comes back, reply here and reference this thread — the context
is saved on my side.
```

FAQ SAMPLE — “MY CLAIM IS NOT SHOWING UP”

Written as a self-serve article, the format a help centre actually needs: cause first, fix second, escalation last.

Why the number is zero

A vesting contract releases tokens on a schedule, and most schedules start with a cliff — a period where nothing unlocks at all. Before the cliff date the claimable amount is genuinely

zero. This is the single most common reason someone believes their allocation disappeared.

Check in this order

- **Cliff date.** Contract detail page → schedule. If today is before the cliff, wait; there is nothing to fix.
- **Claimable amount.** If it shows a number but the button is disabled, the issue is the wallet connection, not the contract.
- **Right wallet.** The contract pays one specific address. If you are connected with a different wallet, you will see the contract but not the allocation.
- **Right contract.** Airdrop allocations and vesting contracts are separate objects. Check both before concluding anything is missing.

When it is genuinely a problem

If the cliff has passed, the connected wallet is the recipient address, and Claimable is above zero but the claim transaction fails — that needs a human. Send the contract address and the transaction signature. Do not send your seed phrase; no support process requires it.

WRITING SAMPLES

Three posts written for X. Hook first, one idea each, no thread padding. Topics are token distribution — the category I know best.

`@isanovski · token unlocks`

everyone checks the unlock date. almost nobody checks who the unlock is going to.

a 2% unlock is nothing if it goes to 400 community wallets.
the same 2% is the whole chart if it goes to one.

Why it works: the reader already believes the first half. The second half reframes a number they thought they understood.

`@isanovski · vesting`

“locked” and “vested” are not the same thing and the difference is usually where people get hurt.

locked = cannot move until a date.
vested = unlocks gradually, on a schedule, whether you are watching or not.

Why it works: corrects a real confusion with two lines the reader can repeat to someone else.

`@isanovski · airdrop safety`

if a token you never bought tells you to connect your wallet to “claim more”, the token is not the reward. it is the bait.

check the mint authority before you check the price.

Why it works: actionable in one sentence, and it is the highest-value warning in the category.

WHAT I AM NOT CLAIMING

I have not held a paid support or moderator title. What I bring is three years of using these products from the user side, the writing, and the habit of checking the documentation before answering. If a role needs someone who has already processed a thousand tickets, that is a fair reason to pass — but the answers above are what those tickets look like, and I wrote them before being asked.
